Next Item

1. What does a neuron compute?

1/1 points A neuron computes the mean of all features before applying the output to an activation function

A neuron computes a function g that scales the input x linearly (Wx + b)

A neuron computes an activation function followed by a linear function (z = Wx + b)

A neuron computes a linear function (z = Wx + b) followed by an activation function

Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1/1 points

$$\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|$$

$$\bigcirc \quad \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = y^{(i)}\log(\hat{y}^{(i)}) + (1 - y^{(i)})\log(1 - \hat{y}^{(i)})$$

Correct

Correct, this is the logistic loss you've seen in lecture!

$$\bigcirc \quad \mathcal{L}^{(i)}(\hat{\boldsymbol{y}}^{(i)}, \boldsymbol{y}^{(i)}) = \mid \boldsymbol{y}^{(i)} - \hat{\boldsymbol{y}}^{(i)} \mid^2$$

$$\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} - \hat{y}^{(i)})$$

3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

1/1 points

x = img.reshape((1,32*32,*3))

 C

x = img.reshape((32*32*3,1))

Correct

x = img.reshape((3,32*32))

x = img.reshape((32*32,3))

4. Consider the two following random arrays "a" and "b":

1/1 points

```
1  a = np.random.randn(2, 3) # a.shape = (2, 3)
2  b = np.random.randn(2, 1) # b.shape = (2, 1)
3  c = a + b
```

What will be the shape of "c"?

c.shape = (2, 3)

Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

The computation cannot happen because the sizes don't match. It's going to be "Error"!

~

5. Consider the two following random arrays "a" and "b":

1/1 points

```
1  a = np.random.randn(4, 3) # a.shape = (4, 3)
2  b = np.random.randn(3, 2) # b.shape = (3, 2)
3  c = a*b
```

What will be the shape of "c"?

c.shape = (2, 1)

The computation cannot happen because the sizes don't match. It's going to be "Error"!

Corros

Correct

Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

- c.shape = (4, 3)
- c.shape = (4,2)
- c.shape = (3, 3)

6. Suppose you have n_x input features per example. Recall that $X = [x^{(1)}x^{(2)}...x^{(m)}]$. What is the dimension of X?

1/1 points

 $\bigcirc (1,m)$

(m,1)

Correct

~

7. Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.

1/1 points

Consider the two following random arrays "a" and "b":

```
1 a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2 b = np.random.randn(150, 45) # b.shape = (150, 45)
3 c = np.dot(a,b)
```

What is the shape of c?

- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (12288, 150)
- c.shape = (12288, 45)

Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

c.shape = (150,150)

V

8. Consider the following code snippet:

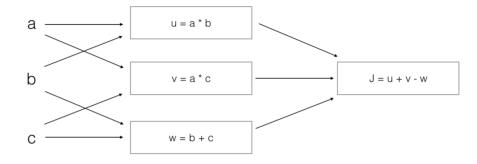

```
1 \# a.shape = (3,4)
Neural Network2Ba#sicspape = (4,1)
                                                                                                   10/10 points (100%)
Quiz, 10 questions
                       4 for i in range(3):
                             for j in range(4):
                               c[i][j] = a[i][j] + b[j]
                    How do you vectorize this?
                            c = a + b.T
                       Correct
                            c = a.T + b.T
                            c = a + b
                            c = a.T + b
                   Consider the following code:
                       1 a = np.random.randn(3, 3)
   1/1
                       b = np.random.randn(3, 1)
  points
                       3 \quad c = a*b
                    What will be c? (If you're not sure, feel free to run this in python to find out).
                            This will invoke broadcasting, so b is copied three times to become (3,3), and * is an
                            element-wise product so c.shape will be (3, 3)
                      Correct
                            This will invoke broadcasting, so b is copied three times to become (3, 3), and \ast
                            invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3,
                            3)
                            This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector.
                            That is, c.shape = (3,1).
```

Quiz, 10 questions

10. Consider the following computation graph.

1/1 points

 \leftarrow

What is the output J?

$$J = (c - 1)*(b + a)$$

$$\int J = (a - 1) * (b + c)$$

Correct

Yes.
$$J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c)$$
.

$$\int J = a*b + b*c + a*c$$

$$J = (b - 1) * (c + a)$$
